

Latches for Rapid, Secure Assembly of Sectional Flooring

TORRINGTON, CT Norse latches are designed for concealed installation in sectional flooring. Multiple configurations of latches and receivers are possible to suit many applications, and offer numerous advantages:

- Exceedingly strong section-to-section compression, with a clamping force holding the floor together of 500 to 550 lbs per latch.
- Yieldable, with forgiveness of installation tolerances to 1/4 inch due to a unique spring loading mechanism.
- Allows for multiple installations including: recessed in from beneath the floor; mortised directly into the center (width) of the flooring sections; mortised into the center (width) of thin floors (5/8 in.) when metal-reinforced edging is used; and beneath raised flooring mounted on vertical supports to create a raceway for pipes, wires, etc.
- Can be installed in flooring as thin as 5/8 in.
- Can be specified with upward-dimpled flanges for flush screw head installation, no protusion.
- Uses a standard hex key for rapid operation (3/4 turn) when compared to installation using standard fasteners (screws).
- Can be operated from above the flooring via a small (5/16 in. dia.) key hole if desired.
- Operable by inexperienced installers with minimal instruction.

Engineering assistance is always available for optimal latch and receiver selection.

Latches can be ordered online at www.norse-inc.com.

About Norse Latches

Since 1960, Norse Inc. has engineered and manufactured America's most versatile latching systems with literally thousands of configurations possible. Sales are worldwide. Proprietary spring-loaded latching mechanisms provide high clamping forces from 200 to over 500 pounds per latch. Latches are vibration proof, surface mounted or mortised, remotely operable, gangable, with steel construction and various plating options. Sealed units available. For wood, metal, plastic and other applications including: military enclosures, aircraft
